一、Summary 摘要

The energy-saving system stores excess energy during the descent of the pumping unit donkey head/elevator car through energy type supercapacitors, for use when the donkey head/elevator car ascends, achieving energy conservation and avoiding "reverse power generation", thereby affecting the safe and stable operation of power supply and distribution. Reasonably adjust the flushing frequency based on the actual situation of the oil well/elevator shaft, improve the efficiency of the mechanical production system/elevator system, avoid insufficient liquid supply and empty pumping, and achieve soft start and stop of the pumping unit motor/elevator motor, improve the system power factor, reduce the impact on the power supply and distribution system, reduce line losses, and optimize the capacity configuration of the power supply and distribution network. After installing this energy-saving system, the energy-saving rate of the entire system can reach at least 40%~50%, and the power factor can reach over 99%.
